- **The seek() method can also be used with other reference points:**

  - **0 for the beginning of the file.**

  - **1 for the current position.**

  - **2 for the end of the file (used as an offset in the example above).**

- **Ensure that the file is opened in a mode that supports seeking. For example, text and binary modes support seeking, but some special file modes (like append mode) might not behave as expected with seek operations.**

By using seek(), you can efficiently control the position of the file pointer and perform operations like re-reading or rewinding the file as needed.
